CI/CD Pitch

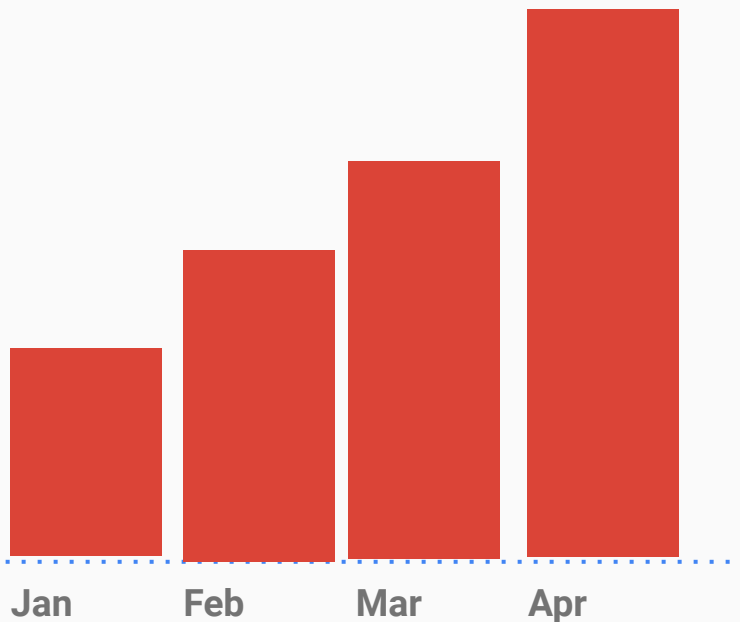

Mission statement:
Your company's
mission goes here

The problem

- For the past few months, we have been getting an increased error rates and failed deployments.
- These failures are consuming alot of our developers time and prevent us from releasing new features.
- This graph show a near average of our failed deployments.

A close-up photograph of a person's hands working on a circuit board. The person is using a soldering iron to solder components. The background is blurred, showing some electronic components and a workbench.

The solution

Introducing CI/CD
pipelines

The magic fix

CI/CD pipelines

- CI/CD pipelines are a way of completely automating our deployment process without the need of human intervention.
- This means that errors or bugs can be found faster and the tedious repetitive process of deployment is now automated.
- This creates the switch of our focus from “Did the deployment fail?” to “is the deployment done yet?”
- Implementing CI/CD will give our developers more time to work on more interesting features, making the release cycles shorter and generating more revenue for the company!.

CI/CD pipelines

- Releasing features faster means our product becomes more attractive to customers.
- And happy customers are always good for business!.

Thank You
